

# STIMULATION OF HAIR GROWTH VS. MARKET REFERENCE

## *Ex vivo* test protocol

- Human hair follicles in anagen phase were cultured with Acetyl Tetrapeptide-3 at  $10^{-7}$ M ( $\approx$  0.016% Capixyl™ solution) or Minoxidil at  $120 \times 10^{-7}$ M during 7 days (Philpot method)
- Hair length variation (=elongation) was measured with a micrometer incorporated in a optical microscope

**Capixyl™ stimulates hair growth with higher activity than the market reference product, Minoxidil**
